

Grapples for Forklifts

Forklift Grapple - Grapples work along with the crowning operation of the bucket cylinder positioned on the excavator. They can mount directly onto the jib or whichever quick hitch which is in bucket position. Grapples are usually utilized for the processing and handling of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This manufactured design provides the grapple with maximum strength and support by means of preventing the body from breaking and rotating through its operation.

The grapple together with all of its moving parts are constructed of hardened steel. The pivot points are designed to be able to guarantee supreme closing force and holding ability. The person operating it has the capacity to deal with different sizes and varieties of supplies using the jaws fitted at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for utmost handling capacity.
